

I wrote my TGE1 in the form of HTML and CSS. It could be much harder to open and view than a regular website. I didn't know how I could make the HTML public online, so I chose to upload everything needed for my HTML to work on GitHub. As people with non-technical backgrounds might find it difficult to open, I created this tutorial for opening the webpage I made.

The code I wrote is majorly in TGE1.html and TGE1.css. However, if you open it directly, you will see the code I wrote. To see the web page it generates, you will need to download the zip file and open the html on your computer

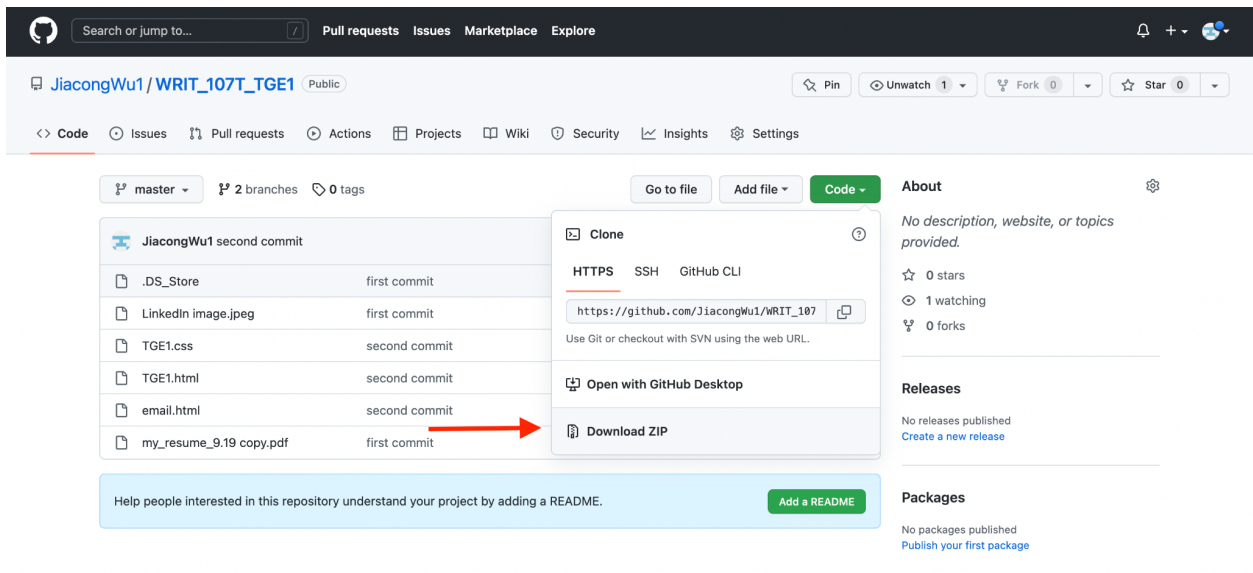

1. First, if you can see this page, then you must have seen the GitHub page for the TGE1 repo.

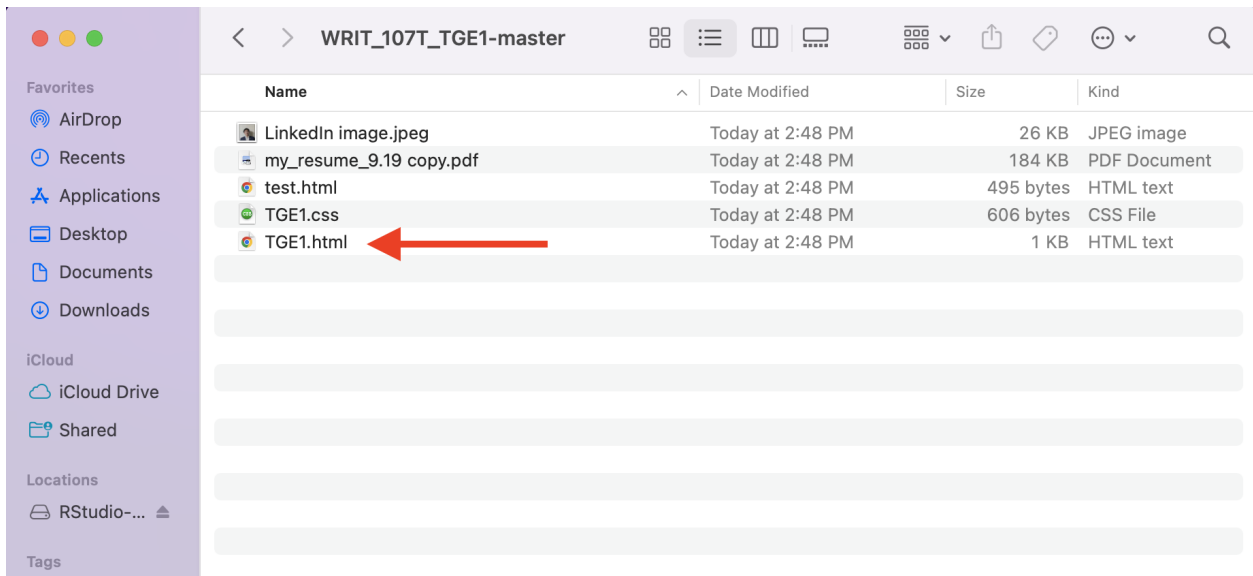

2. Click on the green button which says "Code"

3. Download the the zip file

4. After unzip the file, open the html to see the web page I made

In case there is still a problem opening the web page, I included a screenshot of how the web page looks like at my end.
